

Notes and Guidance

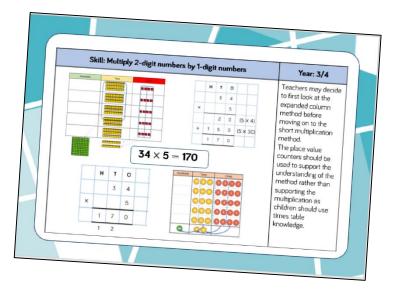

This document is broken down into addition and subtraction, and multiplication and division.

At the start of each policy, there is an overview of the different models and images that can support the teaching of different concepts. These provide explanations of the benefits of using the models and show the links between different operations.

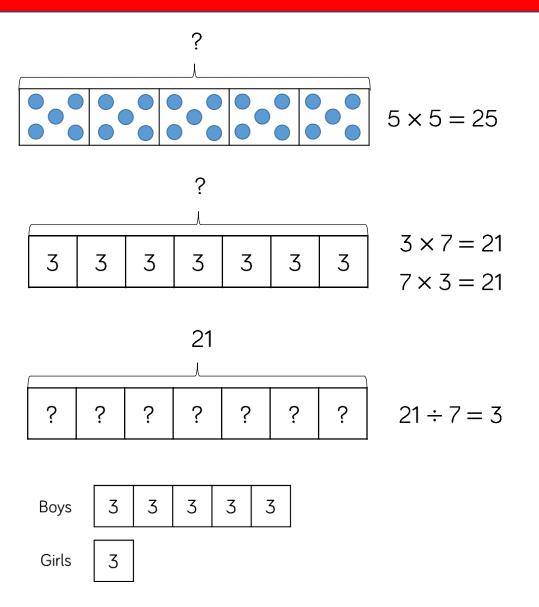

Each operation is then broken down into skills and

each skill has a dedicated page showing the different models and images that could be used to effectively teach that concept.

There is an overview of skills linked to year groups to support consistency through out school. A glossary of terms is provided at the end of the calculation policy to support understanding of the key language used to teach the four operations.

Bar Model

Benefits

Children can use the single bar model to represent multiplication as repeated addition. They could use counters, cubes or dots within the bar model to support calculation before moving on to placing digits into the bar model to represent the multiplication.

Division can be represented by showing the total of the bar model and then dividing the bar model into equal groups.

It is important when solving word problems that the bar model represents the problem.

Sometimes, children may look at scaling problems. In this case, more than one bar model is useful to represent this type of problem, e.g. There are 3 girls in a group. There are 5 times more boys than girls. How many boys are there?

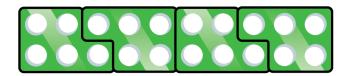

The multiple bar model provides an opportunity to compare the groups.

Number Shapes

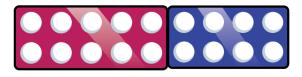

$$5 \times 4 = 20$$

 $4 \times 5 = 20$

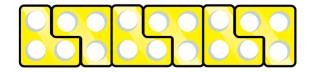

$$5 \times 4 = 20$$

 $4 \times 5 = 20$

$$18 \div 3 = 6$$

Benefits

Number shapes support children's understanding of multiplication as repeated addition.

Children can build multiplications in a row using the number shapes. When using odd numbers, encourage children to interlock the shapes so there are no gaps in the row. They can then use the tens number shapes along with other necessary shapes over the top of the row to check the total. Using the number shapes in multiplication can support children in discovering patterns of multiplication e.g. odd \times odd = even, odd \times even = odd, even \times even = even.

When dividing, number shapes support children's understanding of division as grouping. Children make the number they are dividing and then place the number shape they are dividing by over the top of the number to find how many groups of the number there are altogether e.g. There are 6 groups of 3 in 18.

Bead Strings

$$\frac{5}{3} \times 3 = 15$$

 $\times 5 = 15$

$$^{15} \div 3 = 5$$

$$5 \times 3 = 15$$

$$3 \times 5 = 15$$
 $15 \div 5 = 3$ $3 \times 5 = 15$

$${}^{4}_{5} \times {}^{5}_{4} = {}^{20}_{20}$$

$$20 \div 4 = 5$$

Benefits

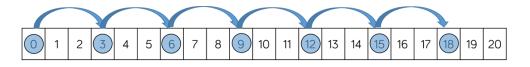

Bead strings to 100 can support children in their understanding of multiplication as repeated addition. Children can build the multiplication using the beads. The colour of beads supports children in seeing how many groups of 10 they have, to calculate the total more efficiently.

Encourage children to count in multiples as they build the number e.g. 4, 8, 12, 16, 20.

Children can also use the bead string to count forwards and backwards in multiples, moving the beads as they count.

When dividing, children build the number they are dividing and then group the beads into the number they are dividing by e.g. 20 divided by 4 - Make 20 and then group the beads into groups of four. Count how many groups you have made to find the answer.

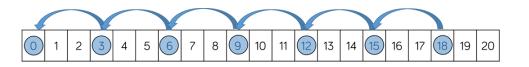

Number Tracks

$$6 \times 3 = 18$$

 $3 \times 6 = 18$

$$18 \div 3 = 6$$

Benefits

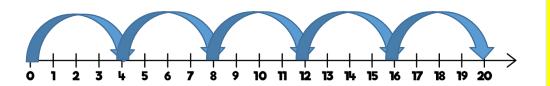

Number tracks are useful to support children to count in multiples, forwards and backwards. Moving counters or cubes along the number track can support children to keep track of their counting. Translucent counters help children to see the number they have landed on whilst counting.

When multiplying, children place their counter on 0 to start and then count on to find the product of the numbers.

When dividing, children place their counter on the number they are dividing and the count back in jumps of the number they are dividing by until they reach 0. Children record how many jumps they have made to find the answer to the division.

Number tracks can be useful with smaller multiples but when reaching larger numbers they can become less efficient.

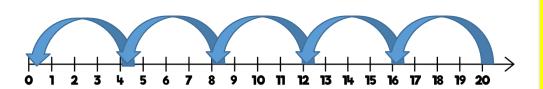

Number Lines (labelled)

$$4 \times 5 = 20$$

 $5 \times 4 = 20$

$$20 \div 4 = 5$$

Benefits

Labelled number lines are useful to support children to count in multiples, forwards and backwards as well as calculating single-digit multiplications.

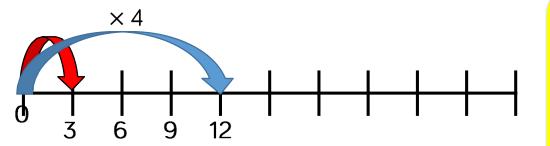

When multiplying, children start at 0 and then count on to find the product of the numbers.

When dividing, start at the number they are dividing and the count back in jumps of the number they are dividing by until they reach O.

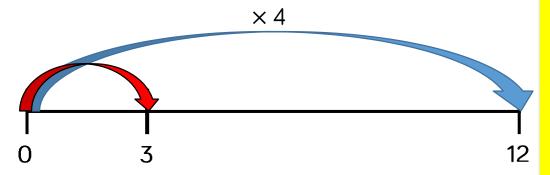

Children record how many jumps they have made to find the answer to the division.

Labelled number lines can be useful with smaller multiples, however they become inefficient as numbers become larger due to the required size of the number line.

Number Lines (blank)

A red car travels 3 miles. A blue car 4 times further. How far does the blue car travel?

A blue car travels 12 miles.

A red car 4 times less.

How far does the red car travel?

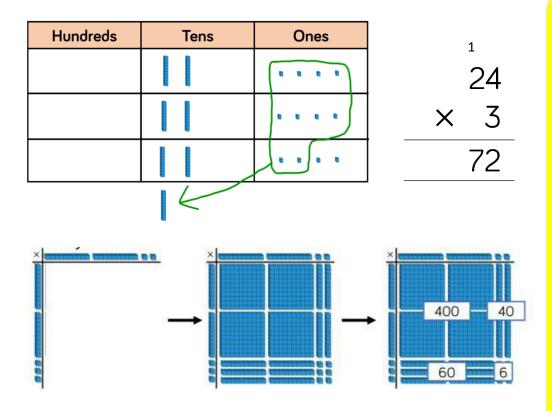

Benefits

Children can use blank number lines to represent scaling as multiplication or division.

Blank number lines with intervals can support children to represent scaling accurately. Children can label intervals with multiples to calculate scaling problems.

Blank number lines without intervals can also be used for children to represent scaling.

Base 10/Dienes (multiplication)

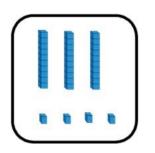

Benefits

Using Base 10 or Dienes is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written representations match.

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed.

Base 10 also supports the area model of multiplication well. Children use the equipment to build the number in a rectangular shape which they then find the area of by calculating the total value of the pieces This area model can be linked to the grid method or the formal column method of multiplying 2-digits by 2-digits.

Base 10/Dienes (division)

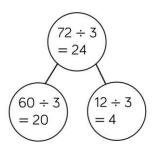

$$68 \div 2 = 34$$

Tens	Ones

$$72 \div 3 = 24$$

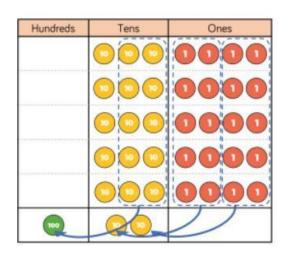

Benefits

Using Base 10 or Dienes is an effective way to support children's understanding of division.

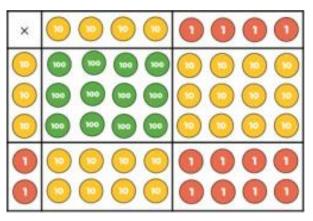

When numbers become larger, it can be an effective way to move children from representing numbers as ones towards representing them as tens and ones in order to divide. Children can then share the Base 10/ Dienes between different groups e.g. by drawing circles or by rows on a place value grid.

When they are sharing, children start with the larger place value and work from left to right. If there are any left in a column, they exchange e.g. one ten for ten ones. When recording, encourage children to use the part-whole model so they can consider how the number has been partitioned in order to divide. This will support them with mental methods.

Place Value Counters (multiplication)

1	2
	34
×	5
•	170

44 × 32
8
80
120
+ 1200
1408
1

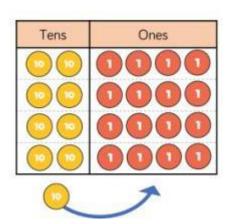

Benefits

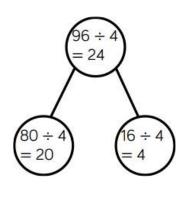

Using place value counters is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written match.

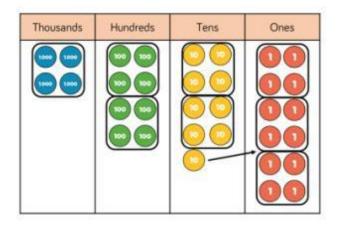

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed The counters should be used to support the understanding of the written method rather than support the arithmetic.

Place value counters also support the area model of multiplication well. Children can see how to multiply 2-digit numbers by 2-digit numbers.

Place Value Counters (division)

1223 4 489¹2

Benefits

Using place value counters is an effective way to support children's understanding of division.

When working with smaller numbers, children can use place value counters to share between groups. They start by sharing the larger place value column and work from left to right. If there are any counters left over once they have been shared, they exchange the counter e.g. exchange one ten for ten ones. This method can be linked to the part-whole model to support children to show their thinking.

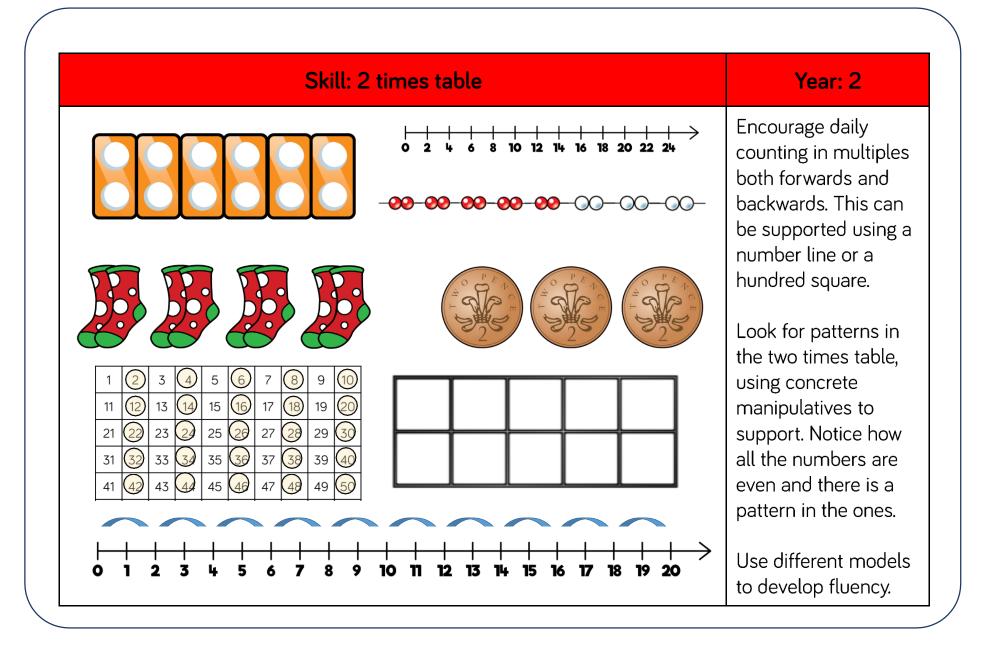

Place value counters also support children's understanding of short division by grouping the counters rather than sharing them. Children work from left to right through the place value columns and group the counters in the number they are dividing by. If there are any counters left over after they have been grouped, they exchange the counter e.g. exchange one hundred for ten tens.

21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	56	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	9	100

Year: 4

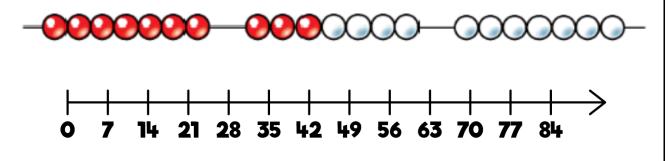

Encourage daily counting in multiples both forwards and backwards. This can be supported using a number line or a hundred square. Look for patterns in the nine times table, using concrete manipulatives to support. Notice the pattern in the tens and ones using the hundred square to support as well as noting the odd, even pattern within the multiples.

Skill: 7 times table

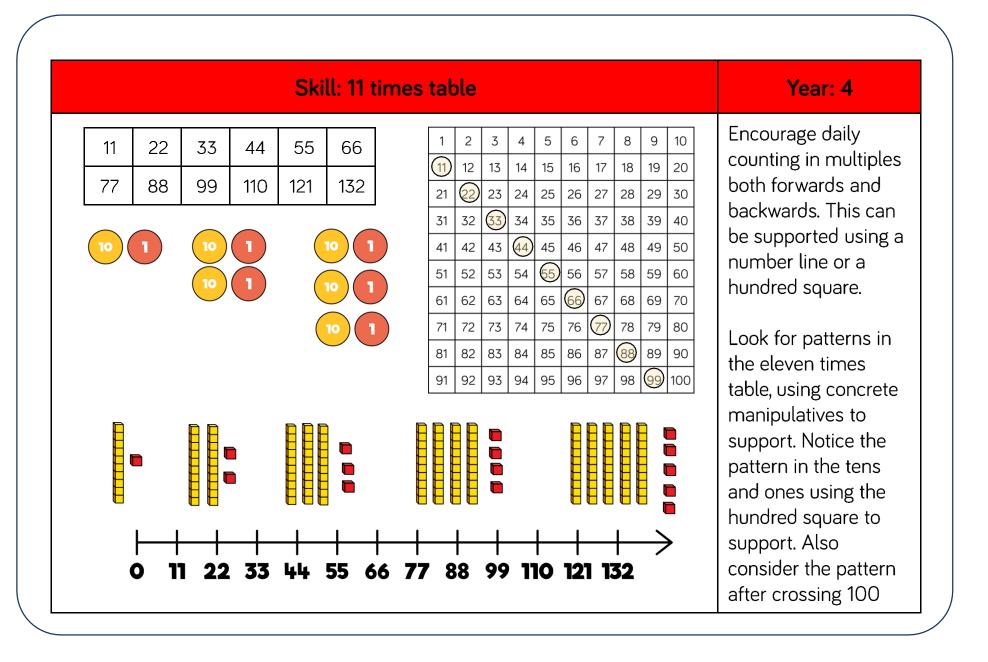

7	14	21	28	35
42	49	56	63	70

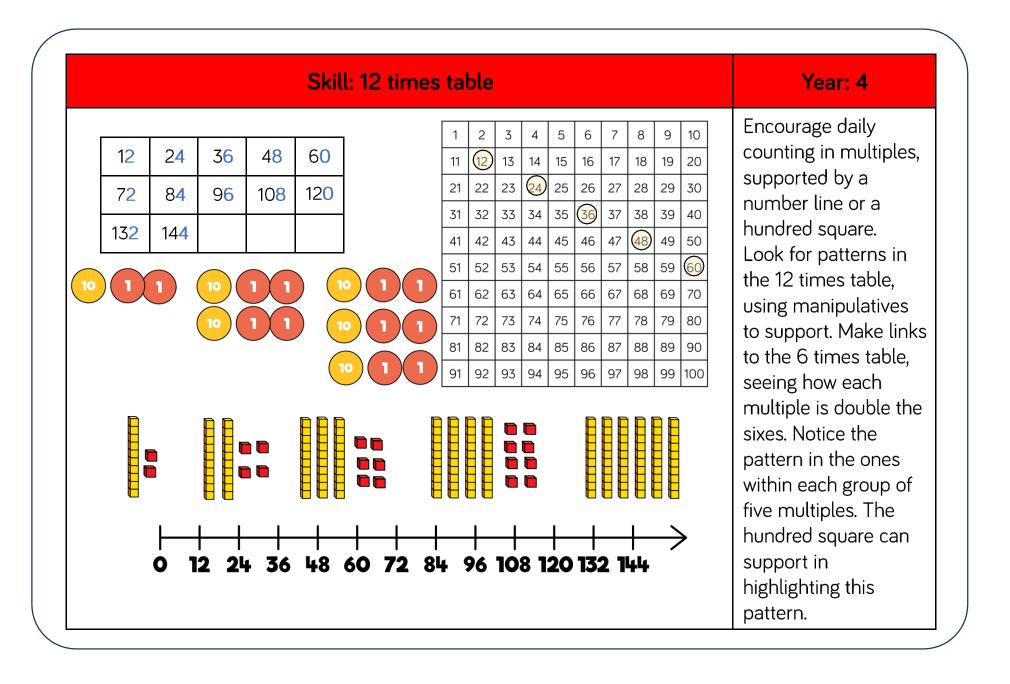

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50
51	52	53	54	55	<u>56</u>	57	58	59	60
61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Year: 4

Encourage daily counting in multiples both forwards and backwards, supported by a number line or a hundred square. The seven times table can be trickier to learn due to the lack of obvious pattern in the numbers, however they already know several facts due to commutativity. Children can still see the odd, even pattern in the multiples using number shapes to support.

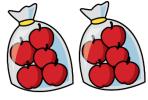

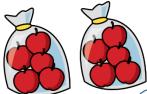

Multiplication

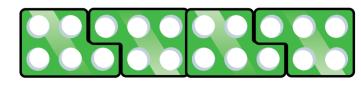

Skill	Year	Representations and models	
Solve one-step problems with multiplication	1/2	Bar model Number shapes Counters	Ten frames Bead strings Number lines

Multiply 2-digit by 2- digit numbers	5	Place value counters Base 10	Short written method Grid method
Multiply 2-digit by 3- digit numbers	5	Place value counters	Short written method Grid method
Multiply 2-digit by 4- digit numbers	5/6	Formal written method	

Skill: Solve 1-step problems using multiplication

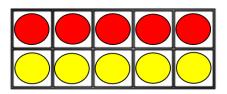

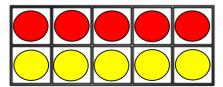

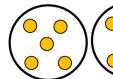

One bag holds 5 apples. How many apples do 4 bags hold?

$$4 \times 5 = 20$$

$$5 \times 4 = 20$$

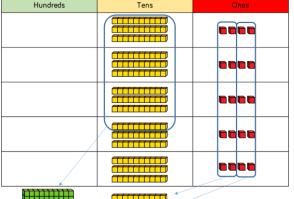

Year: 1/2

Children represent multiplication as repeated addition in many different ways.

In Year 1, children use concrete and pictorial representations to solve problems. They are not expected to record multiplication formally.

In Year 2, children are introduced to the multiplication symbol.

Skill: Multiply 2-digit numbers by 1-digit numbers

	н	т	0		
		3	4		
×			5		
		2	0	(5	× 4)
+	1	5	0	(5 >	(30)
	1	7	0

100 100	10 10 10	00000
100 100	0000	00000
100	10 10	

Year: 3/4

When moving to 3digit by 1-digit multiplication, encourage children to move towards the short, formal written method. Base 10 and place value counters continue to support the understanding of the written method. Limit the number of exchanges needed in the questions and move children away from resources when multiplying larger numbers.

Skill: Multiply 4-digit numbers by 1-digit numbers

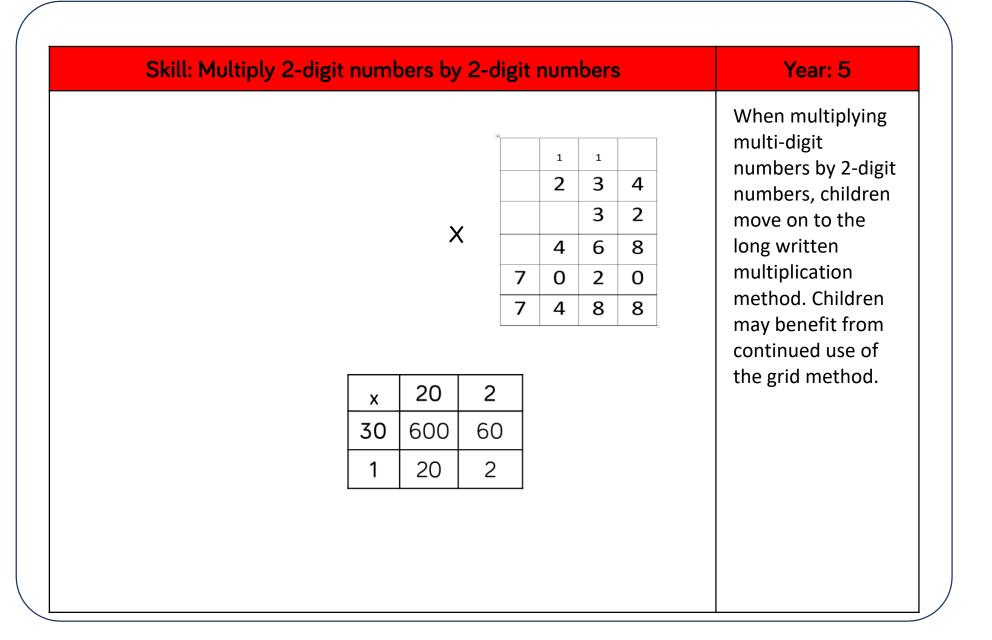

Thousands	Hundreds	Tens	Ones
1000	100 100 100 100	10 10	
1000	100 100 100 100	10 10	
1000	100 100 100 100	10 10

	2		1	
	Th	Н	Т	0
	1	8	2	6
×				3
	5	4	7	8

Year: 5

When multiplying 4digit numbers, place value counters are the best manipulative to use to support children in their understanding of the formal written method. If children are multiplying larger numbers and struggling with their times tables, encourage the use of multiplication grids so children can focus on the use of the written method.

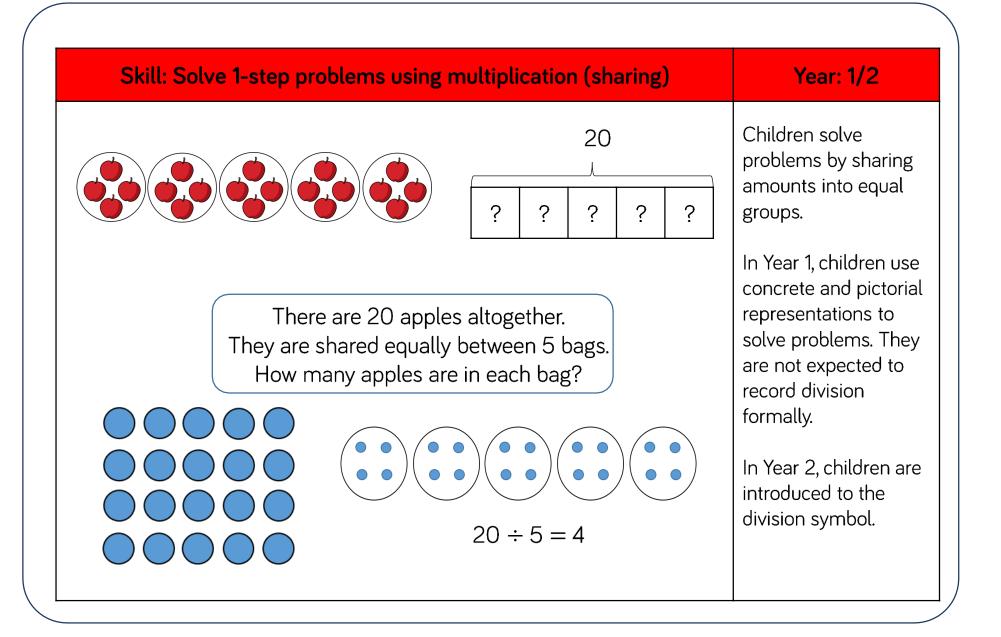

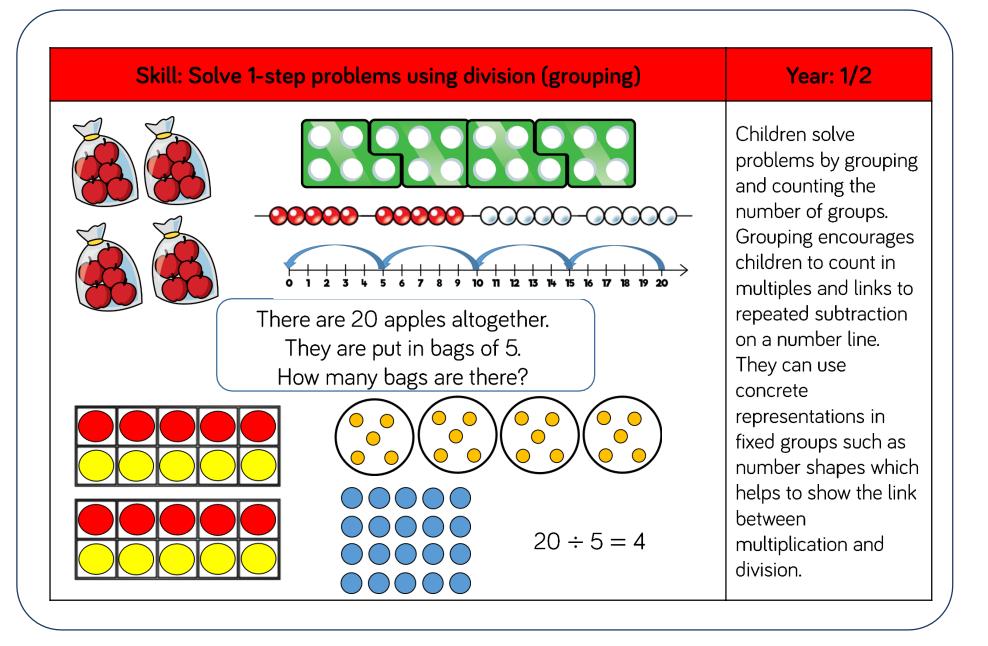

Division

Skill	Year	Representations and models		
Solve one-step problems with division (sharing)	1/2	Bar model Real life objects	Arrays Counters	
Solve one-step problems with division (grouping)	1/2	Real life objects Number shapes Bead strings Ten frames	Number lines Arrays Counters

Skill: Divide 2-digits by 1-digit (sharing with no exchange)

Tens	Ones		
000	000		
10 10			

$$48 \div 2 = 24$$

Year: 1/2

When dividing larger numbers, children can use manipulatives that allow them to partition into tens and ones.

Base 10 and place value counters can all be used to share numbers into equal groups.

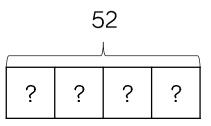

Part-whole models can provide children with a clear written method that matches the concrete representation.

 $52 \div 4 = 13$

Tens	Ones

10 10	000000
Tens	Ones
10	111
10	111
10	111
10	

When dividing numbers involving an exchange, children can use Base 10 and place value counters to exchange one ten for ten ones.
Children should start with the equipment outside the place value grid before sharing the tens and ones equally between the rows.

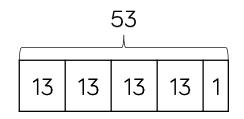

Year: 3/4

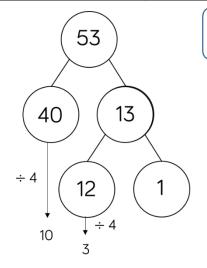

Flexible partitioning in a part-whole model supports this method.

Tens	Ones

53	÷	4	=	13	r1
		•		•	

Year: 3/4

When dividing numbers with remainders, children can use Base 10 and place value counters to exchange one ten for ten ones. Starting with the equipment outside the place value grid will highlight remainders, as they will be left outside the grid once the equal groups have been made.

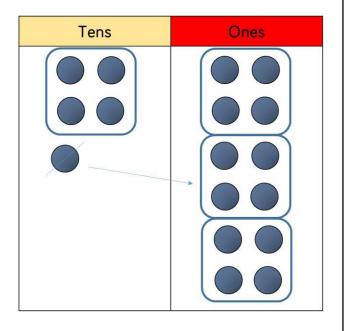

Flexible partitioning in a part-whole model supports this method.

Skill: Divide 2-digits by 1-digit (grouping)

Tens	Ones
10 10	
10 10	1
10	
	1

$$52 \div 4 = 13$$

Year: 4/5

When using the short division method, children use grouping. Starting with the largest place value, they group by the divisor.

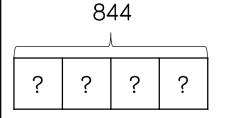

Language is important here.
Children should consider 'How many groups of 4 tens can we make?' and 'How many groups of 4 ones can we make?'

Remainders can also be seen as they are left ungrouped.

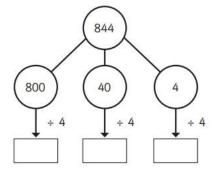

Skill: Divide 3-digits by 1-digit (sharing)

Year: 4

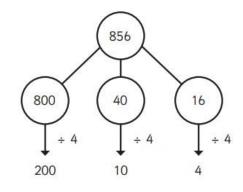

$$844 \div 4 = 211$$

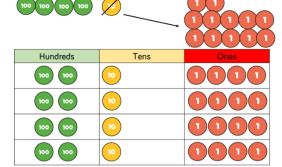

Н	Т	0
100 100	10	1
100 100	10	1
100 100	10	1
100 100	10	1

$$844 \div 4 = 211$$

Children can continue to use place value counters to share 3 digit numbers into equal groups.

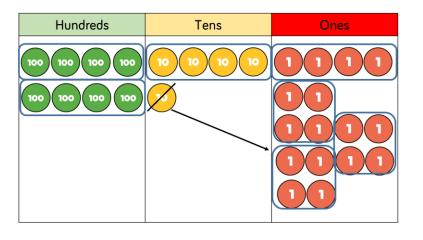

Children should start with the equipment outside the place value grid before sharing the hundreds, tens and ones equally between the rows.

This method can also help to highlight remainders.

Flexible partitioning in a part-whole model supports this method.

Skill: Divide 3-digits by 1-digit (grouping)

	2	1	4
4	8	5	1 ₆

Hundreds Tens Ones

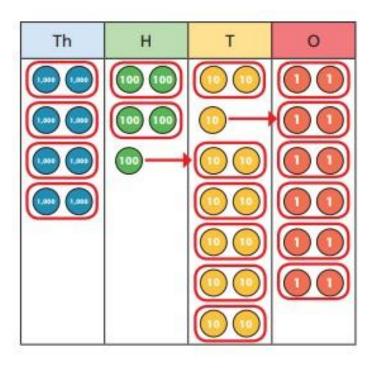

Children can continue to use grouping to support their understanding of short division when dividing a 3-digit number by a 1-digit number.

Place value counters or plain counters can be used on a place value grid to support this understanding. Children can also draw their own counters and group them through a more pictorial method.

 $856 \div 4 = 214$

Skill: Divide 4-digits by 1-digit (grouping)

	4	2	6	6
2	8	5	13	12

Place value counters or plain counters can be used on a place value grid to support children to divide 4-digits by 1-digit.
Children can also draw their own counters and group them through a more pictorial method.

Children should be encouraged to move away from the concrete and pictorial when dividing numbers with multiple exchanges.

 $8,532 \div 2 = 4,266$

Skill: Divide multi digits by 2-digits (short division) Year: 6 When children to divide up to 2 digits by 2-digits written methods become the most accurate as contained and pictorial

$$7,335 \div 15 = 489$$

	0	4	8	9
15	7	7 3	13 3	13 ₅

15	30	45	60	75	90	105	120	135	150

When children begin to divide up to 4digits by 2-digits, written methods become the most accurate as concrete and pictorial representations become less effective. Children can write out multiples to support their calculations with larger remainders. Children will also solve problems with remainders where the quotient can be rounded as appropriate.

Skill: Divide multi-digits by 2-digits (long division)

Year: 6

Does My Sister Burp

			1	5	0	r2	1
2	4	3	6	2	1		
	_	2	4				
		1	2	2			
		1	2	0			
				2	1		

24	×	1	=	24
24	×	2	=	48
24	×	3	=	72
24	×	4	=	96
24	×	5	=	120
24	×	6	=	144
24	×	7	=	168
24	×	8	=	192
24	×	9	=	216
24	×	10	=	240

Children can also divide by 2 digit numbers using long division.

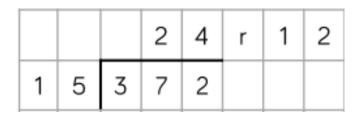

Children can write out multiples to support their calculations with larger remainders.

Children will also solve problems with remainders where the quotient can be rounded as appropriate.

Year: 6

1 5 3 7 2 ⁴

When a remainder is left at the end of the calculation, children can leave it or convert it to a fraction or decimal. This depends on the context.

Children should also be encouraged to attempt to use the factors of a number and complete 2 short division calculation rather than one long division.

Glossary

Array – An ordered collection of counters, cubes or other item in rows and columns.

Commutative – Numbers can be multiplied in any order.

Dividend – In division, the number that is divided.

Divisor – In division, the number by which another is divided.

Exchange – Change a number or expression for another of an equal value.

Factor – A number that multiplies with another to make a product.

Multiplicand – In multiplication, a number to be multiplied by another.

Partitioning – Splitting a number into its component parts.

Product - The result of multiplying one number by another.

Quotient - The result of a division

Remainder – The amount left over after a division when the divisor is not a factor of the dividend.

Scaling – Enlarging or reducing a number by a given amount, called the scale factor
